

# Soft Top Folding Retainer

## Installation Manual

The Jass Performance Soft Top Folding Retainer installs once on each side to prevent the soft top folding at the wrong place, causing the vinyl to be caught between the frame stop/support and the frame stopper.

The retainer has a bracket on the one end, which installs on the bolt used to fasten the front side soft top bracket. To do so, the nut is removed, the bracket slips over and the nut is tightened back.

On the other end the retainer slips simply over the soft top support. The picture above shows it installed in white in situ, in fact it is delivered with black hose for better integration.
